Also disclosed are the nucleic acid molecules encoding the proteins are antibodies that specifically bind protein. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   12-FEB-200X; 2001GB-0003424

proteins from Moraxella catarrhalis. These can be used to produce vaccines which protect against M. catarrhalis infection, which can otitis media, respiratory infection, sinusitus, and pneumonia. The present sequence is a protein of the invention.
                                                                                                                                                                                                           05-SEP-
                                                                                                                                                                                                                                                                                                            29-AUG-

                  Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogen: polypeptides. The proteins and their associated DNA sequences are used the treatment, prevention and diagnosis of medical conditions caused by p. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hyperrosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.
                                                                                                                                                                                                                                                                                                        Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful treating acne vulgaris -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence

The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the prin specification, but was obtained in electronic format directly from WI at fifty.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the arms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 200

The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention.

AAZ54537 to AAZ54576 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                          09-OCT-1998;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               09-OCT-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                 WPI; 2001-088033/10.

This invention relates to an isolated membrane-bound sorbitol dehydrogenase (SDH) from Gluconobacter oxydans. The invention includes polynucleotides (AAC83153 - AAC83154) encoding the 3 subunits of SDH (AAB35987 - AAB35989). Also included in the invention are two polynucleotide sequences AAC83156 and AAC83157 which contain the subunit coding regions. The sorbitol dehydrogenase polynucleotide sequences are useful for producing L-sorbose from D-sorbitol and for increasing the production of 2-keto-L-gulonic acid by transforming a host cell, especially Gluconobacter with the DNA and selecting the transformed host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence is that of encoded by the cytochrome C gene from Gluconobacter suboxydans IFD 12528 which may be used to give improved prodn. of cytochrome C by oxidative fermentation.
                                                                                                                                                                    Novel membrane-bound sorbitol dehydrogenase nucleic acid molecule isolated from Gluconobacter suboxydans useful for the fermentative production of 2-keto-L-gulonic acid and L-sorbose from D-sorbitol
                                                                                                                                                                                                                           WPI; 2000-687351/67.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ś
                        Purified cytochrome c-553 (CO) was isolation from Gluconobacter suboxydans IFO 1258 and partially sequenced. From this information, 32P-labelled oligonucleotide probes were constructed and used too screen a bank of genomic EcoRI fragments from IFO 1258 in vector 13mpl9RP. A plasmid which hybridised strongly contained an approx.

1.5kb fragment which was sequenced. This sequence lacks the N-terminal region which was located from the same source and used to construct a complete gene. The probes used are based on the N-terminal amino acid sequence (KGWGNNA) of peptide I which was isolated following limited hydrolysis of c-553(CO) using arginyl endopeptidase. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                     Plasmid contg. gene for cytochrome C-553 (CO) - and transformed cells useful in high productivity oxidative fermentation, e.g. \epsilon ethanol to acetic acid

                                                                                                                                                           The invention comprises a method for identifying a compound capable of modulating biofilm formation by bacteria. The method of the invention is useful for identifying a compound capable of modulating biofilm formation by bacteria or modulating bacterial antibiotic resistance. The method of the invention is also useful for diagnosing and treating a subject (especially an immunocompromised human) that is afflicted with a biofilm-associated disease or disorder, such as: cystic fibrosis; AIDS; middle ear infections; acne; periodontal disease; catheter-associated infections; and medical device-associated infections. The present amino acid sequence represents a protein that is used in the invention.
                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Biofilm formation modulation; biofilm-associated disease; cystic fibrosis; AIDS; middle ear infection; acne; period

                                                                                                                                                            This sequence represents the D-sorbitol dehydrogenase of the invention. Cells transformed with a recontaining DNA encoding the dehydrogenase can be used to produce L-sorbose or 2-keto-L-gula acid as precursor for simple large-scale L-ascorbic acid production
                                                                                                                                                                                                                                                                                                         Gene group for D-sorbitol dehydrogenase, useful for simple large-scale production of L-sorbose or 2-keto-L-gulonic acid precursor for L-ascorbic acid
                                                                                                                       Sequence

The ADH comples can be easily extracted from the bacteria and purified and it can be used for the determination of an alcohol.

The promoter sequence may be clor into a plasmid in the anti-sense direction with respect to anoth microspore-specific gene and used to transform Brassica sp.

                                                                                                                                                                                                                                                                                                                                                                   In addition the plasmid carries a resistance gene to a chemical agent or stress. The sense and anti-sense genes are regulated sy that they are expressed at about the same time as each other. Transfected plants are pollinated and selected according to
                                                                                                                                                                                                                                                                                                Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a recombinant protein (I) having laccase activity useful in the production of phytoalexins. The phytoalexins produced using are useful for controlling animal pests such as insects e.g. Orthoptera, Dermaptera and Isoptera, mites e.g. Tarsonemus spp. Panonychus spp. and Tetranychus spp. nematodes e.g. Pratylenchus spp. Globodera spp. and Heteroptera spp. and microbial pests such as bacteria and in particular phytopathogenic fungi e.g., Fusarium colmorum, Botryris cinerea, Septoria nodorum, Cercospora cenescens, and pseudocercosporella herpotrichoides. This sequence represents a novel laccase, Bclcc2, isolated from Botrytis cinerea, described in the

                                                                                                       alter e.g. its specific activity or pH-activity profile or to improve expression yields. The mutant laccase is prepd. by site-directed mutagenesis of the rs14 gene [16317] and expression in host cells. The mutation may be a deletion, insertion or pref. a substn. of one or more amino acids at a location no greater than 12 Angstroms, pref. no more than 2.5 Angstroms, from the Type I copper site. The mutant enzyme can be used e.g. for the polymerisation of depolymerisation of flighlins, oxidation of dyes, or polymerisation of phenolic or aniline cpds. present in liquids, e.g. for the treatment of fruit juices.
                                                                                                                                                                                                                         New mutant blue copper oxidase enzymes - having activities to wild-type enzymes, used for e.g. (de)polymerisation or oxidation of dyes
                                                                                                                                                                                                                                                                                                                                                  13-MAR-1997

(NOVO ) NOVO-NORDISK AS

Svendsen A, Xu F;

WPI; 1998-495393/42.

New variants of Coprinus and related laccases with increased oxidation potential - or altered pH optimum, or mediator or oxygen-hydroxide ion pathways, useful for oxidation, for inhibiting dye transfer and in bleaching textiles, especially as detergent additive

Disclosure; Pages 124-125; 147pp; English

C The present sequence represents a laccase protein. The specification describes active laccase variants (see AAW76282, AAW76296-99 and AAW76316-17) having increased oxidation potential, altered pH optimum. altered mediator and/or altered oxygen/hydroxide ion pathway. The

                                                                                                                                                               are based on the previously unknown three-dimensional structure of C. cinereus laccase. Amino acid residues identified as being cimportant to protein stability are identified and altered to improve stability. The variants are typically obtained by cutagenesis of laccase DNA and expression in a host cell. Variants are preferably modified within 15 (especially 10 or 5) Angstrom C are preferably modified within 15 (especially 10 or 5) Angstrom C of a copper ion in the three-dimensional structure of the laccase. For R. solani laccase variants, preferred substitutions are one or more of M128F/H, Y137F, Y129F, Y171F or M78F/V/I/L/Q. The stabilised laccase variants can be used in detergent additives, for dye transfer inhibition in detergents, in bleaching of textiles (in particular denim), for lignin modification, paper strengthening, phenol polymerisation, hair dyeing and in waste water treatment.
                                                                                                                                                                                                                                                                                                                            This is a laccase enzyme of Rhizoctonia solani. The invention relates the design of new variants of Coprinus-like laccases (see AAW60874-79, AAW60925 and AAW62591-03); the R. solani lacc. shows 64.8% homology to C. cinereus laccase. This invention describes novel mutant Rhizoctonia solani laccase enzymes modified to exhibit altered characteristics (e.g. pH activity profile) relative to the wild-type enzyme. The mutant enzymes have a number of commercial and industrial applications. For example, they may be used for the polymerization of lignin (both Kraft and liganosulfates) in solution to produce high molecular weight lignin. They may also be used for the situ depolymerization of lignin in Kraft pulp to produce low molecular
                                                                                                                                        08-FEB-2000

They may also be used for the polymerization of phenolic or aniline compounds in liquids (for example apple juice may be treated with the enzyme to accelerate precipitation of the phenolic compounds in the juice to stabilize it). Additionally, it may be used to decolorize dyes and dye precursors by oxidation. The mutant laccase enzymes exhibit different characteristics to those of the wild-type enzyme. In particular, they may exhibit an altered pH activity profile relative to the wild-type oxidase or altered specific activities. Additionally, they have be produced in large quantities. This sequence represents the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

                                                                                                                                                                                                                                                                                       (CCR), phenylalanine ammonia-lyase (PAL), 4-coumarate:COA ligase (4CL), coniferol glucosyl transferase (CGT), coniferon beta-glucosidase (CBG), caffeic acid methyl transferase, caffeoyl COA methyl transferase, caffeoyl COA methyl transferase, caffeoyl COA methyl transferase, caffeoyl COA methyl transferase, commerate COA ligase, cytochrome P450 LXXIA, diphenol oxidase, flavanol cylucosyl transferase, flavanoid hydroxylase, and isoflavone reductase, which are involved in the lignin biosynthetic pathway. The polynucleotides can be used for modulating lignin content, lignin composition and the structure of a plant, especially eucalyptus and pine species, and for modifying the activity of an enzyme involved in lignin content, composition and structure. They can be used for designing probes and primers useful for detecting similar DNA and RNA sequences in any corganism and for PCR amplification. The lignin content can be efficiently modified using the polynucleotides. AAA67908 to AAA68201 and AAB16341 to AAB16449 represent polynucleotide and protein sequences used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 B
            This sequence represents a full length tobacco laccase (an oxidoreductase acting on diphenols) encoded by the clone pTL-3. The complete protein has a calculated molecular weight of 61.9 kD and a pI of 10.08. The protein has a putative signal sequence of 22 amino acids, leaving a 535 amino acid protein of molecular weight 509.4 kD. The mature protein contains 12 putative N-glycosylation sites (Asn-Xaa-Ser/Thr) and also contains 2 potential copper ion binding sites. The gene sequence was isolated from a cDNA library from tobacco leaves using a probe derived from the sequence of the sycamore (Acer pseudoplatanus) laccase gene. The gene can be used to transform plant cells for producing transgenic plants having a reduced or altered lignin content, for improved digestibility of forage crops, for paper manufacture. Plants with increased lignin content may have better resistance to parasites.
                                                                                                                                                                                                                                                                                                                                                      Modifying lignin biosynthesis in plants with gene encoding laccase mRNA - or its anti-sense complement, especially for crops used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tobacco; laccase; oxidoreductase; probe; hybridisation; sycamore; transgenic plant; digestibility; forage crop; paper manufacture;

Cherry JR,
                                      C. cinereus laccase. Amino acid residues identified as being important to protein stability are identified and altered to improve stability. The variants are typically obtained by mutagenesis of laccase DNA and expression in a host cell. Variants are preferably modified within 15 (especially 10 or 5) Angstrom of a copper ion in the three-dimensional structure of the laccase. For R. solani laccase (II) variants, preferred substitutions are one or more of W411F/H, Y125F, Y134F, Y126F, Y170F or M78F/V/I/L/O. The stabilised laccase variants can be used in detergent additives, for dye transfer inhibition in detergents, in bleaching of textiles (in particular denim), for lignin modification, paper strengthening,
                                                                                                                                                                                                          This is a laccase enzyme of Rhizoctonia solani. The invention relates the design of new variants of Coprinus-like laccases (see AAW60874-79, AAW60925 and AAW62501-03); this R. solani lacc shows 59.7% homology to C. cinereus laccase. The modifications are based on the previously unknown three-dimensional structure
                                                                                                                                                                                                                                                                                                                                 New laccase variants with improved stability - have changes based on Coprinus laccase structure, used oxidation, dye transfer inhibition or bleaching
                          phenol polymerisation,
                                                                                                                                                                                                                                                                                                        Claim

The specification describes active laccase variants (see AAM76282, AAM76296-99 and AAM76316-17) having increased oxidation potential. Altered pH optimum altered mediator and/or altered oxygen/hydroxide ion pathway. The laccase variants are used specifically to oxidise substrates, to inhibit dye transfer, and for bleaching textiles, specifically denim. They can also be used for lignin modification, strengthening paper, polymerisation of phenols, dyeing of hair and textiles and waste
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     oxidation potential - or altered pH optimum, or mediator or oxygen-hydroxide ion pathways, useful for oxidation, for ind dye transfer and in bleaching textiles, especially as detergadditive

The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as herbicides.

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel polynucleotides derived from Coryneform bacteria, mutation point of a gene, measuring expression of a gene expression profile or pattern of a gene and identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         16-DEC-1999; 99JP-0377484.
